

The best part of learning is derived from doing.

For undecided, non-science majors...

Science, like art, is most inspiring when experienced.

Watershed Watch

Watershed Watch is hands-on science focused on understanding our world.

Looking for a Major?

Science : Technology : Engineering : Math

Scary words to anyone who has never experienced the wonders of the world through the eyes of a scientist or a mathematician.

Now take the chance of a lifetime to see these areas put to practical use in local waters while earning valuable college credits.

The Watershed Watch Project is looking for students willing to break out of the classroom and into the water for hands-on research.

Students will use everything from shovels to satellites as they gain valuable college credits.

Get on board today and see how far you can go.

GEOSPATIAL TECHNOLOGIES

Take your studies "out of this world" with the use of Geographical Information Systems (GIS), Global Positioning System (GPS), and other remote sensing tools used to view the Earth, its systems, and its inhabitants in a whole new light.

AQUATIC SCIENCE

Learn what really is in the water around you and exactly how it gets there. Go into the field aboard a research vessel and take samples that become your own research project.

SOCIAL SCIENCE

Look into how the economic growth in your region affects the water in your area. How much heat will that new superstore parking lot create and how will it affect the environment in your area?

TERRESTRIAL SCIENCE

Go global while studying natural (severe weather events) and anthropogenic (poor air and water quality) impacts on the landscape and on watershed function. Use satellite data to map changes over time to the landscape. Discover the human impacts.

MATHEMATICS

Dirty Word? Not when you see the power and beauty it has in problem solving, data analysis, and experimental design.

Take math from a being a hum-drum chore to being your consuming passion.

Watershed Watch

What it is...

Two-week Summer Research Institute
Alternating between the Merrimack Watershed in New Hampshire in 2006 (May 30 - June 10) followed by the Pasquotank watershed in 2007.
- 4 CREDIT HOURS

Academic Year Seminars

Faculty mentoring during a student designed and conducted research project. Two-hour, weekly seminars connecting students on different campuses. - 2 CREDIT HOURS/SEMESTER

Benefits...

\$250 for two week institute

College credits toward required science classes

Tuition Paid

Conferences and Travel

Opening your mind to new people, places, and opportunities to excel!
